

 Backend Team (Node.js, Express, Prisma, SQLite)

Backend Developer Mimi: Database Architecture & Core Infrastructure

- **What they did:** "I designed the core relational database schema using Prisma and built the fundamental user and workspace APIs."
- **Specific Contributions:**
 - Designed the core data models (User, Unit, Workspace, Member) to represent the complex relationships between students and academic groups.
 - Implemented the custom authentication system relying on Registration Numbers and 4-digit PINs.
 - Built the Workspace generation logic, which includes the smart auto-naming feature (combining course units and group numbers) and the unique code-generation for joining workspaces.
 - Implemented the "Destroy Workspace" functionality, ensuring safe, cascading deletion of all related relational data (tasks, resources, etc.).

Backend Developer Nesh: Application Logic & Collaboration APIs

- **What they did:** "I built the RESTful APIs that power the core collaboration features of the platform, including the Kanban board, dashboard metrics, and resource sharing."
- **Specific Contributions:**
 - Designed the data models for the collaboration tools (Task, Milestone, Resource).
 - Built the comprehensive Kanban Board API, handling full CRUD (Create, Read, Update, Delete) operations for tasks, including assigning specific members, updating task status (To Do/In Progress/Done), and setting priorities.
 - Developed the Dashboard metrics aggregation API, dynamically calculating total tasks, active members, shared resources, and upcoming deadlines.
 - Created the Resource Vault API for securely uploading and retrieving shared academic links and documents linked to specific workspaces.

 Frontend Team (React, Vite, Tailwind CSS v4)

Frontend Developer Cynthia : Design System, Layout & Access Flow

- **What they did:** "I architected the frontend application, established the premium glassmorphism design system, and built the authentication and workspace selection interfaces."
- **Specific Contributions:**
 - Configured the modern Vite + React environment and integrated Tailwind CSS v4.
 - Engineered the global UI design system, including the animated mesh gradient backgrounds, sleek glassmorphism cards, custom scrollbars, and global typography (index.css).
 - Developed the WorkspaceAccess interface, creating a smooth, animated form flow for login and registration with validation feedback.
 - Built the dynamic WorkspaceSelectorView and the MainLayout shell, which includes the persistent sidebar, protected routing logic (react-router-dom), and context-aware header.

Frontend Developer 2 Dekow: Interactive Features & Data Integration

- **What they did:** "I built the interactive collaboration views inside the workspace and integrated the frontend with the backend APIs using Axios."
- **Specific Contributions:**
 - Developed the highly interactive TaskBoardView (Kanban Board), creating complex UI states for adding tasks, assigning peers, and visualizing priorities with custom badges.
 - Built the DashboardView, transforming raw backend metrics into a polished, visually appealing overview with progress tracking and recent activity lists.
 - Implemented the ResourceVaultView for categorized sharing of academic links and documents using a clean, responsive table/grid layout.
 - Managed the API integration (via Axios) for these views, handling asynchronous loading states, error catching, and seamless state updates without page reloads.
